

Developing of a High Frequency Word List in Social Sciences

Sorawut Chanasattru
Supong Tangkiengsirisin
Language Institute, Thammasat University

Abstract

This study aimed to develop a high frequency content word list discovered in social science research articles, henceforth referred to as the Social Science Word List (SSWL) from the Social Science Corpus (SSC). The SSC was compiled from 64 open-access English social science research papers from 11 journals in the General Category, published during 2013–2015 on the ScienceDirect website. AntWordProfiler 1.4.0 and AntConc 3.4.3 were employed to calculate the ranges and frequencies of words occurring in the social science corpus, in comparison with the New General Service List (NGSL) and the Academic Word List (AWL). By using Coxhead's range and word frequency criteria, the results revealed that 394 high frequency content headwords and 1,120 word members were obtained. The validation results corroborated that the SSWL can assist teachers in selecting appropriate words. Also, the SSWL is worth introducing to students to familiarize them with essential words for the reading and writing of social science research papers in vocabulary pedagogy, as it exhibits twice the coverage of the AWL in the validating corpora.

Keywords: Corpus, corpus-based lexical study, high frequency social science word list, word list

บทคัดย่อ

งานวิจัยนี้มีวัตถุประสงค์เพื่อพัฒนารายการคำแสดงเนื้อหาที่พบบ่อยในบทความวิจัยด้านสังคมศาสตร์จากคลังข้อมูลบทความวิจัยด้านสังคมศาสตร์ที่สร้างจากบทความจำนวน 64 บทความ จากการสารทางวิชาการแบบเสรี 11 ฉบับ ที่ตีพิมพ์ระหว่างปี 2556-2558 และถูกจัดอยู่ในประเภททั่วไปในฐาน ScienceDirect โปรแกรม AntWordProfiler 1.4.0 และ AntConc 3.4.3 ใช้คำนวณหาค่าความที่และพิสัยของคำที่ปรากฏในคลังข้อมูลบทความวิจัย โดยเปรียบเทียบกับรายการคำที่พบบ่อยในภาษาอังกฤษ (New General Service List) และรายการคำที่พบบ่อยในงานทางวิชาการ (Academic Word List) โดยใช้เกณฑ์พิสัยของ Coxhead และความถี่การปรากฏของคำ ผลการวิจัยพบคำแสดงเนื้อหาที่พบบ่อยในงานวิจัยด้านสังคมศาสตร์ จำนวน 394 คำหลัก และสามัญของคำหลัก 1,120 คำ นอกจากนี้ ผลการตรวจสอบพบว่าคำแสดงเนื้อหาที่พบบ่อยส่วนใหญ่นั้นเป็นคำที่ปรากฏในเอกสารทางวิชาการ และรายการคำที่ได้นิยมครอบคลุมคำในคลังข้อมูลทดสอบบทความวิจัยด้านสังคมศาสตร์โดยมากกว่ารายการคำที่พบบ่อยในงานทางวิชาการ ประมาณสองเท่า จึงเห็นได้ว่ารายการคำแสดงเนื้อหาที่พบบ่อยในบทความวิจัยด้านสังคมศาสตร์นี้ หมายความที่จะแนะนำให้นักเรียนได้คุ้นเคยกับคำศัพท์ที่จำเป็นในการอ่านและเขียนงานวิจัยทางด้านสังคมศาสตร์

คำสำคัญ: คลังข้อมูล, การศึกษาคำศัพท์โดยใช้คลังข้อมูล, รายการคำที่พบบ่อยทางสังคมศาสตร์, รายการคำ

Introduction

Vocabulary knowledge is a key aspect in reading proficiency (Nation, 2001; Chanier & Selva, 1998; Groot, 2000). The importance of vocabulary is affirmed in a famous quotation from David Wilkins, who wrote that "...while without grammar, very little can be conveyed. Without vocabulary, nothing can be conveyed" (Wilkins, 1972, pp. 111–112). Like Wilkins, Lewis (1993, p. 89) declared that "Lexis is the core or heart of language". These quotations exemplify that without sufficient knowledge of vocabulary, English learners can neither understand a text nor convey their own ideas. Vocabulary acquisition is regarded as a vital factor in learning a foreign language since vocabulary knowledge has a direct effect on the reading and writing proficiency of English learners (Nation, 2001). For academic purposes, learning vocabulary aids students' academic achievement because vocabulary greatly contributes to reading comprehension and proficiency (Chanier & Selva, 1998; Tozcu & Coady, 2004). Students who have better vocabulary knowledge generally perform better in reading comprehension. Previous vocabulary knowledge also has a considerable effect on the reading comprehension of university students (Constantinescu, 2007). Students who have high levels of previous vocabulary knowledge can read faster than those who have a limited vocabulary (Calvo, Estevez, & Dowens, 2003). Additionally, vocabulary knowledge is very closely and positively related to reading comprehension (Stahl, 1990; Salah, 2008; Anjomshoa & Zamanian, 2014). Vocabulary knowledge can assist reading comprehension, and reading can in turn contribute to an increase in vocabulary size (Chall, 1987). Similarly, a substantial vocabulary size can contribute to reading comprehension (Groot, 2000). It is impossible to understand texts either in one's own language or in a foreign language without understanding essential vocabulary (Laufer, 1997). Moreover, not only does general vocabulary knowledge affect students' reading comprehension, but specific

vocabulary also assists students to comprehend a specific text effectively (Mehrpor & Rahimi, 2010). Readers' familiarity with the key vocabulary of a particular field combined with reading strategies leads to better reading comprehension (Mehrpor & Rahimi, 2010). From the aforesaid studies, teaching specific vocabulary not only leads to greater familiarization with general vocabulary, but also facilitates students to comprehend a text more effectively.

Regarding vocabulary pedagogy in Thailand, inadequate vocabulary knowledge is one of the predicaments that Thai students encounter when reading (Aegpongpaow, 2008). Many educational institutions introduce new vocabulary to their students to prepare them for reading and writing assignments for academic texts in specific fields. However, one problem is that teachers cannot decide which vocabulary should be introduced to prepare students to read and write research articles. This is because they do not know which words frequently appear and are truly representative of the vocabulary in specific fields. To this end, this study attempted to develop a Social Science Word List (SSWL), a list of content words representing words frequently utilized in social science research articles. The aim is for the SSWL to be used in vocabulary pedagogy in both undergraduate and graduate studies in the field of social science. Teachers, instructors and course designers of English for Academic Purposes (EAP) and English for Specific Purposes (ESP) may select appropriate vocabulary to introduce to students studying in the social science field. This word list can assist undergraduate and graduate students in familiarizing themselves with essential words useful for the reading and writing of social science papers.

Research Question

This study intended to develop a high frequency content word list in social science research papers. The research question of this study is as follows:

“What content words are found most frequently in social science research papers?”

Literature Review

Vocabulary classification Nation (2001, p. 11) classified vocabulary into four groups as follows:

High Frequency Words

High frequency words refer to words that appear most often in printed materials. High frequency words include both function words: *the, a, in, for*, etc. and content words: *social, forests, student, research*, etc. A well-known list of high frequency words is Michael West's (West, 1953) General Service List (GSL), which contains approximately 2,000 word families. Another high frequency word list, created by Charles Browne, Brent Culligan and Joseph Phillips, is known as the New General Service List (NGSL). The New General Service List (NGSL) is a new vocabulary list obtained from a major update of West's GSL. The NGSL contains 2,801 headwords divided into three levels, which represent the most significant high frequency words of the English language required by L2. The NGSL covers more than 90 percent of most general English texts (Browne, 2014).

Academic Words

Academic words are derived from academic textbooks or academic materials in different registers, for instance: linguistic, politics, business, etc. These words cover about nine percent of the running words in the texts. The most well-known academic word list is Coxhead's Academic Word List (AWL). The AWL includes 570 word families covering around 10 percent of academic texts (Coxhead, 2000; Coxhead & Byrd, 2007). However, it covers only 1.4 percent in fiction, which is the same size as academic texts (Coxhead, 2000). This group of words is most suitable for learners who want to read or write academic texts.

Technical Words

Technical words are closely associated with topics and subject areas, and they vary depending on subject area. These words cover around five percent of the running words in a text. This word group can be identified by systematically limiting the range of topics or language investigated or by using a technical dictionary. In technical dictionaries, approximately 1,000 entries in each dictionary are technical words. Both academic and technical words are sometimes known as specialized words.

Low-frequency Words

Low-frequency words are a very large group of words that rarely occur. They account for only a small proportion of any text or only about five percent of the words in an average academic text. These words consist of words that are not high frequency words, not academic words, and not technical words in a particular subject.

Low-frequency words can be proper names, or words that are infrequently used.

Word Classes

The traditional approaches to language analysis divide words into nine classes: nouns, verbs, adjectives, pronouns, prepositions, conjunctions, adverbs, determiners, and interjections (Nunan, 2013, p. 48). Many single words may be classified into different classes according to their function and meaning in a sentence. In English, the vocabulary system consists of closed class and open class categories.

Closed Class

Closed class refers to a class to which no new words are added. This class is sometimes also called “function words” or “grammar words” (Nunan, 2013, p. 49). Members of function words include adverbial particles, auxiliary verbs, conjunctions, determiners, modal verbs, numbers, prepositions, pronouns, and quantifiers (Gilner & Morales, 2006; Nation, 2001; Nunan, 2013). Although function words are small, they make up a significant amount of corpus running words. Johansson and Hofland (1989) as cited in Nation (2001, p. 206) points out that function words cover around 43–44 percent of the running words in most texts.

Open Class

Open class denotes a class to which new words can be added easily. Nouns, verbs, adjectives and adverbs are associated with this class. This class may sometimes be called “content words”. Content

words play a significant role in allowing English users to communicate about different events or states of affairs. New content words, which are added to the English lexicon, prevent fossilization in the language (Nunan, 2013).

Previous Studies on Word List Developments

Word lists have been studied in diverse registers. For example, Wang, Liang, and Ge (2008), created a 623 word family Medical Academic Word List (MAWL) from a one million word medical corpus. Words included in the MAWL must appear at least 30 times in the medical corpus. Vongpumivitch, Huang, and Chang (2009) created a 1.5 million word corpus from applied linguistics research articles called the ALC from 200 applied linguistics research articles from five international journals: *Applied Linguistics*, *Language Learning*, *The Modern Language Journal*, *Language Research*, and *TESOL Quarterly*. The 585 applied linguistics word list was obtained from words that appeared at least 50 times in the ALC. Moreover, word lists in education (Mozaffari & Moini, 2014) and nursing (Yang, 2015) registers have been developed. Mozaffari and Moini (2014) created a 356 educational word list from a 1.7 million word corpus compiled from 239 research articles in the education field. Words found at least 50 times in the educational research article corpus and appearing more than five times in all the educational journals were included. Similarly, Yang (2015) unveiled a 676 nursing word list that was created from around a one million word Nursing Research Articles Corpus (NRAC) from 252 nursing research papers. Words discovered more than 33 times in the NRAC and occurring more than 11 times in 21 subject areas were included in the nursing word list. Also, Hsu (2013) developed a list of 595 frequently occurring word families in medical science called the Medical Word List (MWL) obtained from

a corpus of 155 textbooks in 31 medical areas from 15 million running words of e-book databases by employing range and frequency of words that were outside the most frequent 3,000 word families of the British National Corpus. The MWL accounted for 10.72 percent of the medical textbooks in this study. Medical instructors who use the MWL can raise students' awareness and foster vocabulary knowledge of the commonly used medical words in medical textbooks. Conversely, some word lists have been generated from smaller size corpora. Shabani and Tazik (2014), for example, generated the Revised Academic Word List (RAWL) from around a 300,000 token corpus obtained from 120 English research articles from two journals ' ESP and Asian EFL journals. Words occurring at least nine times in the corpus and at least twice in each journal were included in the RAWL. Likewise, Liu and Han (2015) created a total of 458 words of the Environmental Academic Word List (EAWL) based on around an 800,000 running word corpus from environmental research papers.

From the aforementioned studies, most researchers selected words based on range as the first criteria followed by word frequencies, similar to Coxhead's AWL word selection (Coxhead, 2000). Furthermore, West's GSL was criticized for being based on an outdated and relatively small corpus (approximately 2.5 million running words) compared to current corpus standards. GSL was also disparaged for not clearly defining "word" (Browne, Culligan, & Phillips, 2013). For this reason, the New General Service List (NGSL), which was based on a more modern and ten times larger corpus -- around 273 million words -- than the GSL, was employed in this study. In addition, corpus have usually been compiled from textbooks; research articles in diverse fields such as medical, agricultural, linguistics, financial, or education; or from politics, economics and business news. Nevertheless, social science research articles have seldom been the focus of studies.

Methodology

Journal and Paper Selection

The Social Science Corpus (SSC) was generated from open-access English academic articles in the Social Sciences, General Category of the ScienceDirect website (<http://www.sciencedirect.com>) published during the period 2013–2015 in order to avoid outdated words. These articles were statistically selected by the simple random sampling method. Some journal sections, such as forewords, editorials, and book reviews, were excluded.

Data Standardization

Graphs, charts, diagrams, equations, bibliographies, text headers, footnotes, author's name and affiliates, or other parts of the texts that cannot be processed by concordance programs were removed from the research paper files as suggested by Chen and Ge (2007) by using PDF editing software. Standardized PDF paper files were then converted to UTF-8 plain text format in order to avoid the wrong character conversion from non-English language characters. These text files were checked for typographical errors, and all hyphenated words were joined together as a single word. Subsequently, the running words of each text file were counted before combining them to create a journal sub-corpus. The running words of each journal were limited to between 36,000 to 39,000 running words. This was done to balance the number of running words in order to avoid word selection bias arising from long texts. The SSC consisted of 11 sub-corpora from 11 journals in different areas in the social science field. The journal information, subject areas used in Social Science Corpus (SSC), as well as the number of articles, types and tokens of each journal are displayed in Table 1.

Table 1 Summary of journals used in the social science corpus (SSC)

ID	Journal Title	Subject Areas	No. of Articles Used	No. of Types	No. of Tokens
S_1	Energy Research & Social Science	Energy Technologies, Fuels, Resources, and Energy Production Affecting People	4	4,501	38,131
S_2	Environmental Innovation and Societal Transitions	Innovations and Socio-Economic Transitions, Environmental Problems, and Environmental Sustainable Economy	4	4,194	38,261
S_3	Procedia – Social and Behavioral Sciences	Social Behavioral Sciences concerning Arts and Humanities	11	4,904	37,878
S_4	Public Relations Review	Public Relations, Mass Communications, Organizational Communications, Marketing Management and Public Policy Formation	6	5,038	37,732
S_5	Sport Management Review	Sport Management and Marketing	4	4,504	38,799
S_6	Studies in Communication Sciences	Public Communication	5	4,489	35,985
S_7	The Journal of Social Studies Research	Social Science Studies	5	4,384	38,074
S_8	The Social Science Journal	Social Sciences, Humanities, and Natural Sciences	7	4,709	38,253
S_9	Travel Behaviour and Society	Travel Behavior, Transportation and Environmental, Transportation Geographic Information Systems (TGIS)	6	4,067	38,869
S_10	Wine Economics and Policy	Wine Business and Economics Management	6	4,880	36,481
S_11	Urban Climate	Urban Climatic Conditions and Change concerning Geography Demographic, and Socioeconomic	6	4,316	36,082
		Total	64	49,986	414,545

Research Tools

Reference Word Lists

New General Service List (NGSL)

The New General Service List (NGSL) version 1.01 was downloaded from the website “A New General Service List (1.01)” (<http://www.newgeneralservicelist.org>). The list contains words with three different levels of occurrence in Microsoft Excel format. Level one represents the 1,000 words that appeared most frequently in general English. The second and third levels present the next most frequent 1,000 words and 801 elements of vocabulary in general English, respectively. At each level, headwords and their word members were reformatted in the same pattern as in the Academic Word List (AWL) so that the AntWordProfiler could identify headwords and their word family members as suggested by Paul Nation’s Range program and Laurence Anthony’s AntWordProfiler help file. The list is comprised of headwords in the left column and family members characterized by Bauer and Nation’s Level 6 scale: inflectional suffixes of Laurie Bauer and Paul Nation’s word family taxonomy (Bauer & Nation, 1993), by right indenting. The NGSL includes the headwords in all parts of speech and all inflected forms but excludes headwords with a prefix and headwords with non-inflectional suffixes (derivational suffixes) as a different headword. Discrepancies between American English and British English spelling words are grouped within the same headword, but the NGSL presents an American English spelling word as a headword and assigns a British English spelling word as a headword member (Browne, 2014). High frequency words in general English such as numbers, days of the week, and months of the year were excluded from the NGSL and from this study. The New General Service List (NGSL) is comprised of 2,801 headwords and 8,452 family members.

Academic Word List (AWL)

The Academic Word List (AWL) contains headwords and family members characterized by Bauer and Nation's Level 6 scale: frequent but irregular affixes. This level of affixes contains all inflections and the most frequent and regular prefixes and suffixes, such as *-able*, *-ee*, *-ic*, *-ify*, *-ion*, *-ist*, *-ition*, *-ive*, *-th*, *-y*, *pre-*, *re* (Bauer & Nation, 1993, p. 261). The AWL classifies British English spelling words as a headword and sets American English spelling words as a word member. The Academic Word List (AWL) consists of 570 headwords and 3,107 family members. The AWL can be downloaded from the Victoria University of Wellington, New Zealand at <http://www.victoria.ac.nz/lals/resources/academicwordlist/awl-headwords>.

Concordancers

Anthony's AntWordProfiler (1.4.0) and AntConc (3.4.3) (Anthony, 2014a, 2014b) were used in this study. In this study, the General Vocabulary Profiling Tool of the AntWordProfiler (1.4.0) was the primary tool used to generate statistical values, the range and the frequency of the appearance of words across sub-corpora in the social science corpus, in comparison with the New General Service List (NGSL) and the Academic Word List (AWL). The AntConc (3.4.3) was only used to exclude function words out of content words.

Social Science Word List (SSWL) Generation Process

Stage 1: word selection criteria

Word selection for the SSWL was also based on the method by which Coxhead (2000) selected words for the Academic Word List (AWL). The range and frequency criteria as utilized by Coxhead's Academic Word List (AWL) were employed in this study. The word range was the first criterion to consider word selection to avoid the domination of long texts or extremely high frequency words in some subject areas. This was followed by word family frequency and uniformity of frequency' minimum frequency of a word family occurring in each sub-corpus. To be precise, a word family range had to appear in at least five from 11 sub-corpora with a word family frequency of at least 10 times in each sub-corpus, and the word families had to occur at least 100 times in 414,545 running words to be counted in the SSWL, which is the same criteria used by Coxhead. The method of comparing the corpus running word size to Coxhead's calculated range and word frequency ratios was not employed in this study. This was because the Social Science Corpus (SSC) is more than seven times smaller than Coxhead's corpus. If the idea of proportion were applied, the range and the frequency of word sizes would be only two and 14 times, respectively, in the whole SSC, which is extremely low, thus resulting in an abundance of representative words in the Social Science Word List (SSWL). In terms of uniformity of frequency, word family members had to be present at least ten times in each corpus. Furthermore, words selected for the SSWL could be those appearing in the NGSL or in the AWL. This concept was dissimilar to Coxhead's word selection in that the words in the AWL must be the word families that are not listed in West's General Service List (GSL) (1953), a 2,000-frequency word list. This was because the present study aimed to create a list of words that are frequently used in social science research

articles, which can be either high frequency words found in general English texts or academic words found mainly in academic papers and research articles. The word output obtained from this stage was amalgamated with function and content words.

Stage 2: functional word removal

The Stop List function of the AntConc (3.4.3) program (Anthony, 2014a) was applied to separate function words from content words. In this study, the list of function words was modified using Paul Nation's list of 320 function words (Nation, 2001) as a primary function word list. In addition, some function words in Gilner and Morales' list (Gilner & Morales, 2006) were added for function words that were not listed in Paul Nation's list, for example, *across*, *against*, *because*, *whether*, etc. to filter only the content words. Only content words were retained to be employed in the creation of the Social Science Word List (SSWL).

Stage 3: word list examination

Proper names, prefixes, numbers, or words from other languages than English were removed from the list of content words. Finally, the words remaining in this stage were the Social Science Word List (SSWL).

Establishing the Validity of the Social Science Word List (SSWL)

Headword rank comparison and coverage were employed for validation of the SSWL. Firstly, the rank of the SSWL headwords were compared to those in the Corpus of Contemporary American English (COCA) Core Academic Vocabulary List (AVL) (Davies & Gardner, n.d.,-a), and the COCA Most Frequent Word List in Academic English (Davies & Gardner, n.d.,-b). Secondly, the coverage of the SSWL was checked with two small validating corpora containing new social science research papers in accordance with the method suggested by Liu and Han (2015); both corpora were generated using the same paper selection criteria and the method used in the SSC creation. The first validating corpus was compiled from 20 research papers selected from different social science academic journals used in the SSC compilation, while the other corpus was created from 20 research papers taken from the same social science academic journals used in the SSC compilation.

Results and Discussion

This study aimed to investigate and develop the Social Science Word List (SSWL), a high frequency content word list from social science research papers, in order to answer the following research question: “What content words are found most frequently in social science research papers?”

Identification of the Social Science Word List (SSWL)

The Social Science Word List (SSWL) differed from most word lists in previous studies that presented academic words in diverse registers. The SSWL contained both high frequency general words and academic words, since, in fact, social science academic papers might contain high frequency general words, academic words, technical words, as well as low frequency words as classified by Nation (2001, p. 11). In order to familiarize students with high frequency words used in social science research papers, they are required to learn high frequency words found in general English texts in addition to academic words used mainly in academic papers and research articles. This notion is also in accordance with the study of Mehrpour and Rahimi (2010), which found that general vocabulary and specific vocabulary both play a crucial role in effective reading comprehension.

The first 1,000 headwords of the NGSL accounted for 62.18 percent (245 words), whilst the next 1,000 headwords in the second level and the following 801 word families in the third level of NGSL covered 5.33 percent (21 words) and 0.25 percent (1 word), respectively. In total, the SSWL contained 267 headwords from the NGSL covering 67.77 percent. Additionally, content words accounted for 32.24 percent (127 words). One content word — *better*, which was not shown in either the NGSL or the AWL, was also included in the SSWL by grouping it as a word family member under the headword *good*, which represents the closest meaning of the word *better*. Word family members of each head word in the SSWL were drawn from those in the AWL and the NGSL that occurred in the SSC. Any word family members that were not present in the SSC were removed. The SSWL consisted of 394 content words and 1,120 word family members in all three levels of the NGSL and AWL as presented in Table 2.

Table 2 Summary of the Social Science Word List (SSWL)

Word Type	Reference Word List				Total
	NGSL– Level 1	NGSL– Level 2	NGSL– Level 3	AWL	
Content Words (SSWL)	245 (62.18%)	21 (5.33%)	1 (0.25%)	127 (32.24%)	394 (100.00%)

A complete list of the 394 headwords and 1,120 word family members of the SSWL is presented alphabetically in Appendix A.

Examination of the validity of the Social Science Word List (SSWL)

The SSWL was examined for validity by two methods: headword rank comparison and SSWL coverage.

Headword Rank Comparison

The first method was comparing the rank of the SSWL headwords to those in the Corpus of Contemporary American English (COCA) Core Academic Vocabulary List (AVL) (Davies & Gardner, n.d., a) sorted by word frequency in the social science genre and the COCA Most Frequent Word List in Academic English (Davies & Gardner, n.d., b). First frequency-sorted headwords in the SSWL were compared to the 3,015 headwords of The COCA Core AVL. If the headwords in the SSWL were not found in the COCA Core AVL, the COCA 20,000 Most Frequent Word List in Academic English was used to check the SSWL's word rank instead. The results revealed that, as can be seen in table 3, among the 394 SSWL headwords, 232 headwords (58.88 percent) were academic words found in the COCA Core AVL in the social science category. Meanwhile, the rest (162 headwords

or 41.12 percent) were high frequency words in the COCA Most Frequent Word List.

Table 3 Summary of the number of SSWL headwords found in the COCA word lists

COCA Word Lists	No. of Headwords	Percent
Core Academic Vocabulary List	232	58.88%
Most Frequent Word List in Academic English	162	41.12%
Total	394	100.00%

It is interesting to note that 17 out of the 162 SSWL headwords found in the COCA Most Frequent Word List in Academic English were domain-specific words. These words occurred with a frequency at least three times higher in one or two among the nine genres in the COCA corpus. As demonstrated in table 4, these words were mostly found in the genres of Education, Education and Social, Medical, Finance, Law, and Religion. For example, the words *community*, *program*, *utilize*, *learn*, *implement*, *diverse*, *skill*, and *ability* were discovered mainly in the field of Education; the words *behavior* and *statistic* primarily occurred in Education and Social, while the words *invest* and *company* were found chiefly in Finance.

Table 4 List of headwords found in the COCA most frequent word list in Academic English classified by other domains

No.	Reference Word List	Head word	Range	Freq.	Rank in COCA Word List	Domain
1	AWL	community	8	680	134	Education
2	NGSL-1	program	8	350	89	Education
3	NGSL-1	behavior	6	333	211	Education and Social
4	NGSL-1	risk	7	331	399	Medical
5	AWL	invest	8	301	1835	Finance
6	NGSL-1	health	5	269	174	Medical
7	AWL	utilise	7	264	2204	Education
8	NGSL-1	company	6	260	187	Finance
9	NGSL-1	learn	5	236	243	Education
10	AWL	implement	7	180	1124	Education
11	AWL	regulate	6	160	2363	Law
12	AWL	diverse	5	152	1579	Education
13	NGSL-1	skill	6	152	365	Education
14	AWL	statistic	6	118	8417	Education and Social
15	NGSL-3	frequency	5	117	1330	Medical
16	NGSL-2	self	6	176	1297	Religious
17	NGSL-1	ability	5	100	434	Education

The Social Science Word List (SSWL) Coverage

The second method was an examination of the coverage of the SSWL with two validating corpora. To this end, two small-sized corpora containing new social science papers were compiled according to the method of Liu and Han (2015). The headwords and their word family members in the SSWL file used in the coverage examination of both validating corpora were formatted in the same pattern as the AWL. Both validating corpora were created using the identical paper selection criteria and method that were applied in the creation of the SSC. Each corpus, however, had discrepancies in the following details:

The Validating Corpus 1 (VC01)

The twenty research papers in this corpus were selected from ten social science academic journals in the General Category, which was different from those used in the SSC. Two research texts were statistically selected from each journal. The VC01 contained 113,472 tokens.

The Validating Corpus 2 (VC02)

This validating corpus was also comprised of twenty academic papers derived from the same social science academic journals as those used in the compilation of the SSC, but the research papers used in the VC02 differed from those used in the SSC. Also, two research texts were statistically chosen from each journal. The VC02 comprised 140,411 tokens.

The results revealed that on average, the SSWL accounted for 21.52 percent and 24.16 percent in validating corpus 1 (VC01) and validating corpus 2 (VC02), respectively. Usually, the AWL accounts

for around 10 percent in academic texts (Coxhead, 2000; Coxhead & Byrd, 2007). The coverage of the SSWL in the two corpora was higher than those of the AWL, occurring in 5.5 to 17.6 percent of all papers of both validating corpora. The SSWL, however, covered higher than 20 percent in all social science academic papers taken from the same journals as those in the SSWL in the second validating corpus (VC02). To be precise, the SSWL covered from 21 to 29 percent in all papers (VC02_A1–VC02_J2). On the contrary, in the first validating corpus (VC01) collected from papers from different social science journals, 14 out of 20 social science papers presented SSWL coverage of more than 20 percent, whilst the coverage of the rest ranged from 14.0 to 18.0 percent. The coverage details of the SSWL and the AWL in each paper of both validating corpora are shown in table 5.

Table 5 Summary of the coverage of SSWL in each paper of validating corpora

Papers compiled in VC01	Coverage		Papers compiled in VC02	Coverage	
	AWL	SSWL		AWL	SSWL
VC01_A1	10.5	21.4	VC02_A1	12.3	22.0
VC01_A2	9.6	25.8	VC02_A2	12.2	21.1
VC01_B1	13	21.5	VC02_B1	12.9	24.4
VC01_B2	9.5	15.3	VC02_B2	12.1	23.5

Pedagogical Implications of the Social Science Word List (SSWL)

The Social Science Word List (SSWL) is aimed at being a ready-to-use word list for teachers, instructors and course designers of English for Academic Purposes (EAP) and English for Specific Purposes (ESP) in social sciences for undergraduate and graduate students. As presented in Appendix A, the SSWL consists of 394 headwords and their family members. As illustrated in Figure 1, the word on the left-hand side represents the headword and words indented to the right are their members. The number at the end of each word indicates its frequency in the SSC.

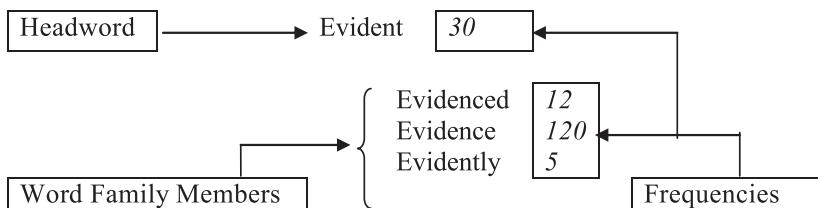

Figure 1 Structure of headwords and word family members of the Social Science Word List (SSWL)

Instructors should begin by introducing word families and their members found in the NGSL level 1 since the NGSL level 1 consists of the most frequent words among level 2 and 3. After students are familiar with the word families in the NGSL level 1, instructors may shift to teach them word families from NGSL levels 2 and 3 respectively. Introducing the word families found in the NGSL is consistent with the findings of Hirsh and Nation (1992) and Na and Nation (1985),

which suggested that L2 learners require a minimum of 3,000 high frequency English words so as to increase their understanding to at least 95 percent. Subsequently, after students have learnt the words from the NGSL, instructors should then introduce words from the AWL, since the coverage of the AWL was found to be far lower than the NGSL at just around 10 percent in academic texts (Coxhead, 2000; Coxhead & Byrd, 2007). This agrees with the findings of Nation and Kyongho (1995), and Mehrpour and Rahimi (2010), which suggested that both high frequency English words in the GSL and academic words in the AWL should be introduced to students studying in academic reading and writing classes. To be clearer, instructors may not need to teach all the word families and their members appearing in the SSWL. Instead, they may opt to introduce high frequency words. For instance, regarding the word family *evident* in Figure 1, in case of time constraints, teachers may introduce words with high frequency first because these words were discovered most often in social science research articles. For the word family *evident*, instructors may teach it only as a noun *evidence* and an adjective *evident*, which were the first and second ranks of frequency at 120 times and 30 times in the SSC, respectively. Moreover, information on word frequencies can also assist teachers to teach students how these words are frequently used in real academic prose contexts.

The SSWL can be applied in myriad ways. Flashcard learning is an effective direct vocabulary learning method for words from the SSWL regarding the return on time and effort spent for students who have limited knowledge of vocabulary. Learners and teachers can control vocabulary learning repletion and deliberately focus on some necessary words that cannot be easily gained from context or dictionary use methods (Nation, 2001; Nation & Meara, 2002). Teachers can create flashcards using headwords or word family members from the SSWL on one side and put word definitions on the other side. Other

lexical information, for instance, pronunciation, part of speech, collocations, grammatical patterns, and contexts in use, can also be added to flashcards to enhance learners' understanding (Nation & Meara, 2002). Nowadays, computer technology can aid teachers in producing their own flashcards without cutting paper. Many free and paid websites offer services for teachers that facilitate the creation of their own sets of flashcards effortlessly. To name a few, Quizlet (<https://quizlet.com>) is a free online vocabulary flashcard website generator allowing teachers or instructors to create their own flashcards by uploading the SSWL. The website not only creates online flashcards but also generates other useful online learning materials such as exercises and Scatter -- an interactive game. Meanwhile, Memrise (<http://www.memrise.com>) contains an outstanding feature that allows users to add Mempty, a picture of things or words associated with learning words, which can assist learners in memorizing target words.

The Limitations of the Social Science Word List (SSWL)

Word Frequency Counting

The major limitation of this corpus-based study derived from the limitations of the AntWordProfiler. The program automatically counts word frequency and groups of words with the same word forms that the program can recognize together without the classification of word class or word meaning in context. For instance, AntWord Profiler counts the adjective or adverb *fine* and the singular noun *fine*, or the proper noun *Fine* together under the same word family *fine* regardless of its meaning in context. Moreover, the word frequencies in SSWL are not tied to their meanings. The SSWL only presents frequencies of words discovered in social science research papers. The list does not distinguish how many times the word *fine* is in the

adjective class, in which it means “good”, from its meaning in the noun class of “money paid for punishment”.

Multiword Units

Multiword units are exceptions in the SSWL due to the occurrence of a space between them. AntWordProfiler counts and identifies words by noticing a space between each word. For this reason, multiword units are counted separately; for example, the word work out is counted as two separate words: one content word work and one function word out. Each word is stored under separate word families. This case differs from the counting of the word workout, with AntWordProfiler counting this word as one word.

American English and British English Spelling variations

The SSWL does not focus on the occurrence of American English and British English spelling variations in social science research articles. Consequently, the differences of the word frequency in American English and British English spelling variation was not taken into account in this study. The SSWL groups words with American English and British English spelling variations with their frequency together as one word as demonstrated in Appendix A.

Conclusion

This study created the Social Science Word List (SSWL), a list of 394 high frequency content words in social science research papers from 64 open-access English research papers in the social science, General Category in the ScienceDirect website. A total of 267

content words in the SSWL (67.77 percent) divided into three sub-levels at 62.18 percent, 5.33 percent, and 0.25 percent, respectively, were primarily derived from high frequency English words in the NGSL, whilst 127 academic words in the AWL (32.24 percent) were also included in the SSWL (Table 2). Although this result revealed that the SSWL mainly contained high frequency words rather than academic words, the first validity result corroborated that 232 words in the SSWL (58.88 percent) represented academic words in social science research papers in COCA Core AVL, while the rest (162 words) were general English words excluded from academic texts (Table 3). In terms of coverage, the second validity result demonstrated that on average the SSWL covered around 20 percent of academic words in social science papers, higher than the coverage of the AWL. The SSWL is worth introducing to students in order to familiarize them with the words occurring in social science research paper rather than relying on words from the NGSL or the AWL for the following reasons: The majority of words in the SSWL are academic words in the social science field compared with the words from the COCA Core AVL and the COCA Most Frequent Word List in Academic English, which were created from an enormous corpus. The SSWL can help learners to save time because the SSWL contains fewer words than the NGSL and the AWL, and the words in the SSWL are more genre-specific to the social science field than those in the AWL, which was compiled from academic texts in four disciplines: Law, Art, Commerce, and Science (Coxhead, 2000). Additionally, on average, the coverage of the SSWL is twice as high as the AWL, ensuring that learners using the SSWL have a greater chance to encounter words in academic texts in the social science field.

The limitations of this study are as follows. The SSWL was created from the SSC, a corpus compiled from academic papers only in the social science, General Category. In fact, social science in the

ScienceDirect website includes 12 other subject areas. Furthermore, the SSC contained only around 400,000 running words, and was therefore comparatively smaller than other corpora. These drawbacks may lessen the chances of discovering vocabulary that frequently appears in social science research articles. Apropos the limitations of the Social Science Word List (SSWL), three major restrictions, namely, word frequency counting, multiword units, and American English and British English spelling variations, were also highlighted as a reminder to teachers and instructors using the SSWL.

Appendix A

The Complete List of 394 Word Families and 1,120 Word Family Members of the Social Science Word List (SSWL)

Below is the complete alphabetical list of the 394 word families of the Social Science Word List (SSWL) and their word family members. Words in *italics* indicate words that were found in the Social Science Corpus (SSC). The end of each word is marked with an asterisk (*) or a caret (^) symbol to indicate the word list that the word family was derived from: * for words from NGSL Level 1, ** for words from NGSL Level 2, *** for words from NGSL Level 3, and ^ for words for words from AWL. The number at the end of the symbol indicates the frequency of that word in the SSC. Words with American English and British English spelling variations are presented together and counted as one word.
