Received August 7, 2025 ; Revised December 27, 2025; Accepted December 31, 2025

### **Abstract**

This study systematically analyzes the application value and practical impact of artificial intelligence (AI) technology in the innovation of vocal art forms. The aim is to trace the integration and evolution of AI technology with vocal art, elucidating the intrinsic mechanisms by which technology empowers vocal art and the paradigm shifts it triggers. This paper employs a qualitative approach, combined with case studies, to reveal how intelligent technology challenges and reshapes traditional vocal teaching models, aiming to provide theoretical support and practical guidance for the future development of vocal art. Through this study, it is hoped to deepen the understanding of AI technology's application in the field of vocal art, promote the deep integration of technology and art, and drive the intelligent transformation of vocal education and creation. The findings highlight the profound impact of AI technology on vocal art, particularly in the innovation of educational models, creative techniques, and artistic expression. The study not only demonstrates how intelligent technology optimizes the vocal education process, enhancing teaching efficiency and quality, but also explores the potential of AI to expand the boundaries of vocal creation and enrich artistic expressions. The discussion includes the necessity and feasibility of the intelligent transformation of vocal art forms, as well as strategies for achieving harmonious coexistence between technology and art while ensuring the essence and ethical principles of art. The study emphasizes the importance of building an ethical principle and art value mapping system, proposing implementation strategies for full-process ethical embedding and dynamic evaluation feedback mechanisms. Additionally, it explores specific paths for intelligent transformation from multiple dimensions, including creation, performance, and education, pointing the way for the future development of vocal art forms.

**Keywords:** innovation, vocal art, artificial intelligence

### **Introduction**

The AI technology revolution is sparking an unprecedented wave of innovation in the arts, particularly in vocal music. The application of cutting-edge technologies is profoundly transforming the ways we create, perform, and teach. The integration of algorithmic composition, holographic projection, virtual reality, and voiceprint analysis is shaping a new human-machine co-creation ecosystem in the arts. In response to the challenges faced by traditional vocal music, AI technology has offered numerous innovative solutions. For instance, intelligent vocal coaching systems, leveraging machine learning, have significantly enhanced teaching efficiency and effectiveness; intelligent composition platforms, through style deconstruction and reconstruction, have greatly reduced the costs and barriers to creation; brain-computer interface devices, by adjusting the acoustic environment, offer multi-dimensional immersive aesthetic experiences. The involvement of AI technology not only promotes the sustainable development of vocal music but also provides a vibrant digital ecosystem for this art form.

In the realm of music education, a deep learning-driven voiceprint diagnosis cloud platform has overcome geographical and resource barriers, enabling learners in remote areas to access professional-level assessments and guidance. New neural symbol systems, such as LyraComposer 2.0, integrate knowledge graphs with reinforcement learning to generate vocal motif development chains with emotional evolution logic. The integration of these technologies is reshaping the art ecosystem, fostering a collaborative evolutionary mechanism among creators, performers, and audiences.

The significance of the research lies in constructing a theoretical model that integrates artificial intelligence with vocal art, promoting theoretical innovation and development, and providing guidance and reference for vocal artists and AI technology experts. In practice, AI technology can help overcome limitations in education and resources, promote educational equity and industrial upgrading, enrich the forms of vocal art expression and application scenarios, and enhance the efficiency and reach of dissemination.

Global AI music research is showing multidimensional development trends. Overseas, the focus is on developing neural network composition algorithms, while domestic research has a distinct local flavor and has made significant breakthroughs. Research in vocal art forms primarily focuses on the digital analysis of singing techniques and the iterative upgrades of intelligent generation systems. As multi-modal large model technology continues to mature, China has reached the international forefront in the intelligent reconstruction of all elements of vocal performance. (Xin, Q., 2023; Original Document, 2025; Renwen Library, 2025; Yingxian, Z., 2024; Toutiao APP, 2023)

## **Research objective**

1. To study explore the intelligent innovation trend of vocal art form path

## **Literature review and Concepts**

1. The academic context of the integration of artificial intelligence and vocal art

Since 2010, technology has been integrated into vocal education, with the widespread use of audio software like Cubase and Audition driving the digital transformation of music creation and teaching. In 2018, speech recognition technology began to be used in vocal instruction, focusing on pitch and rhythm, but it lacked real-time feedback and personalized adaptation. Currently, voiceprint analysis technology quantifies scales and beats, but its delays affect the immediacy of teaching and make it challenging to adapt to different vocal parts and singing styles. With advancements in edge computing and adaptive algorithms, new systems are expected to offer faster responses and more personalized teaching. Since 2020, deep learning technology has driven the application of CNN and RNN hybrid architectures in audio feature extraction, using mel spectrum analysis and time-frequency transformation techniques to accurately model speakers' timbral characteristics and identify subtle emotional changes. In educational technology, systems monitor learners' language fluency, attention, and cognitive load in real time by mapping acoustic features to teaching scenarios. Multimodal data analysis supports adaptive learning path planning and knowledge consolidation strategies in language learning and intelligent tutoring systems, promoting the transition of personalized teaching to data intelligence. Virtual choir platforms leverage cloud technology to enable global singers to collaborate and interact visually and aurally, with intelligent mixing engines precisely adjusting sound source positioning. Holographic projection technology, combined with dynamic capture and 3D light field

reconstruction, creates interactive stereoscopic images and forms multidimensional audio-visual effects through intelligent light and shadow algorithms. The integration of these technologies is driving the music industry towards a mixed reality form, achieving systemic transformation.

## 2. Progress in core research areas

The AI vocal education technology path involves real-time data collection by an intelligent evaluation system, which analyzes pitch and spectrum, and provides visual feedback and weekly reports to support graded training. A personalized learning model, based on GAN, generates practice pieces tailored to learners of different skill levels. The 'dual-teacher' teaching approach combines professional teachers with AI-assisted teachers, sharing resources to enhance teaching quality and efficiency, and enriching the student experience. In vocal composition, AI technology integrates classical and electronic music to create original works, such as the AI adaptation of 'Spring River Moonlit Night.' Automated composition tools use LSTM to automatically generate melodies, enhancing creation efficiency and style diversity. Despite ethical concerns raised by the application of AI in the field of vocal art, technologically neutralists argue that AI is a tool for iteration, and audiences still emotionally connect with AI-assisted works. (Douding Network, 2024; Xin, Q., 2023; Han, S., 2025; Yingxian, Z., 2024; Human Library, 2025)

## Research Methodology

This research is qualitative method, employing case analysis, expert interviews, and literature review. Case analysis will involve a detailed examination of the application of AI technology in vocal arts, revealing both its practical effects and potential issues. Expert interviews will invite three experts from fields such as education, computer science, and musicology to discuss the prospects, technical challenges, and ethical regulations of AI technology in vocal arts. Literature review will systematically review relevant research findings both domestically and internationally, providing a solid theoretical foundation for this study. Through these methods, this study aims to comprehensively reveal the current status, existing problems, and challenges of AI technology in vocal arts, and propose targeted improvement measures and development suggestions.

## Research Results

The research findings have identified the intelligent innovation trends in the development of vocal art forms. Through a comprehensive analysis of technological practices and theoretical advancements, this study has revealed four key paths for intelligent innovation in vocal art forms, empowered by artificial intelligence. These paths are characterized by deep technological integration, human-machine collaboration, and the reconfiguration of multidimensional forms. The following are the specific research conclusions:

### 1. Intelligent teaching mode: from experience inheritance to data-driven

1.1 The popularization of intelligent evaluation and real-time feedback system: The intelligent evaluation and real-time feedback system, utilizing voice analysis software and sensor technology, provides precise feedback on key parameters such as pitch, timbre, and resonance during singing or playing. This technology upgrades traditional teaching methods to data-driven precision teaching. For instance, the intelligent pitch assistance system can analyze real-time changes in sound, offering immediate feedback to help learners quickly master techniques. The intelligent vocal training platform developed by the School of Music at Shanxi University can

automatically diagnose students' singing issues and generate personalized practice suggestions, thereby enhancing vocal skills. This platform not only reduces the workload of teachers but also improves teaching efficiency and effectiveness. (Xin, Q., 2023)

1.2 Virtual teaching and research room promotes the universal benefit of educational resources: By leveraging the advantages of blockchain and 5G communication technologies, we can digitize the best vocal music courses from both domestic and international sources and share them across schools and regions. This innovative educational model effectively addresses the imbalance in teaching resources caused by geographical constraints in traditional education. For instance, in the case of the virtual teaching and research room at the Central Conservatory of Music, advanced technology enables top vocal teachers and course resources to transcend geographical boundaries, providing high-quality music education to a wider audience. This not only enhances the efficiency of educational resource utilization but also offers students more diverse learning options, promoting educational equity. (Han, S., 2025)

## **2. Innovation of creation path: from manual creation to man-machine co-creation**

2.1 Generative AI Breaks Style Boundaries. AI composition systems based on Transformer architecture, such as Google Magenta, can skillfully blend Baroque polyphonic elements with modern electronic music techniques. This advanced technology enables AI to create musical works that transcend time and space. For example, it can transform the classical masterpiece 'Spring River Moonlit Night' into an electronic variation, creating a new musical experience. Through this variation, the melody, originally rich in classical charm, is given the rhythm and texture of modern electronic music, allowing listeners to experience the fusion of different eras and styles within the same piece. This innovative integration not only showcases the powerful capabilities of AI composition systems but also opens up endless possibilities for music creation. (Yingxian, Z., 2024)

2.2 Sound Cloning Technology Restructures Creative Ethics. Researchers have used deep learning technology to replicate the unique timbre of singers, such as the 'AI Jay Chou' project that replicated Jay Chou's voice. However, this technology has sparked copyright disputes. To address these issues, sound watermarking technology has been introduced. This technology embeds copyright information into digital sounds, allowing the original owner to prove ownership even if the sound is copied or distributed. Sound watermarking technology achieves copyright identification by embedding imperceptible marks in audio signals, which do not affect the listening experience. In copyright disputes, the original owner can extract these marks to prove ownership. Additionally, sound watermarking technology helps track illegal dissemination and piracy. In short, sound watermarking technology provides a powerful protection measure for copyright owners. (Yingxian, Z., 2024)

## **3. Performance form elevation: from physical stage to virtual and real coexistence**

3.1 Holographic projection and augmented reality technology applications. Virtual singers, such as the virtual character named 'Xiao Qin,' can perform on the same stage with real singers thanks to advanced 3D modeling and real-time motion capture technology. This unique performance style is vividly demonstrated in the Baidu Metaverse Singing Festival, showcasing a 'virtual-real dual' stage aesthetic that blends the virtual and the real. On this stage, virtual singers not only have realistic appearances but also mimic the movements of real singers in real time through motion capture technology, making their interaction feel natural and smooth. This innovative performance method not only offers audiences an unprecedented visual and auditory

experience but also opens up new possibilities for the future development of stage art. By integrating these technologies, virtual and real singers create a magical performance space where audiences can enjoy music while experiencing the charm of the perfect fusion of technology and art.

3.2 Audience participation in interactive performances. Through brain-computer interface (BCI) technology, we can collect real-time EEG data from the audience. This data is then transmitted to an advanced AI system. The AI system analyzes the EEG data to dynamically adjust the concert's arrangement parameters. As a result, each audience member at the concert can enjoy a unique and personalized experience, as if the music is tailored for them. This technology transforms concerts from monotonous performances into personalized experiences, tailored to the real-time reactions and preferences of each audience member. Audiences will experience an unprecedented interactive experience, as if music is directly engaging with their minds, creating a new way of appreciating art. (Wenjun, Y. and Liang, L., 2023)

#### **4. Reconstruction of educational ecology: from one-way transmission to ecological learning**

4.1 Construction of a Metaverse Vocal Training Classroom: A virtual vocal training space is created, integrating advanced VR equipment and intelligent feedback systems. In this environment, students can engage in immersive vocal training. They feel as if they are in a real opera house, interacting with AI mentors. This method not only provides an immersive experience but also allows students to receive real-time feedback on their vocal performance and suggestions for improvement through the intelligent feedback system. For example, NetEase Tianyin's virtual singing practice module is a prime example, using virtual reality technology to enable students to practice in a virtual opera house, thus enhancing their vocal training experience.

4.2 The 'Dual-Teacher' Teaching Model Becomes Mature: In the education sector, a collaborative model between professional teachers and AI-assisted teachers is gaining popularity. By effectively distributing tasks, this model maximizes teaching effectiveness. AI-assisted teachers focus on basic skills training, such as using breathing control simulators to help students breathe correctly and providing real-time feedback to improve learning efficiency. Professional teachers, on the other hand, concentrate on enhancing students' artistic expression, offering personalized guidance to help them understand the deeper meanings of musical works and express emotions. This 'technology standardization + art personalization' approach ensures systematic and standardized teaching while respecting and stimulating students' individuality and creativity, promoting balanced development in both technical and artistic skills, and cultivating well-rounded artistic talents. (Xin, Q., 2023; Han, S., 2025)

In summary, the application of technology in the field of vocal music is becoming increasingly widespread, forming a closed loop from data collection to intelligent decision-making. This has not only improved efficiency but also opened up new possibilities for vocal art. The collaboration between artificial intelligence and human artists has become more intimate, enabling artists to create a wider range of works through AI, thus expanding the boundaries of art. The trend towards diversification in artistic forms is evident, with vocal art achieving hypertext expression through the integration of virtual and real elements and cross-media storytelling. This has broken traditional limitations, created new aesthetic experiences, enriched artistic expression methods, and paved new paths for the development of vocal art.

## Research Discussion

**1. Intelligent transformation of teaching mode:** My view is that the intelligent transformation of teaching models has not only reshaped the landscape of vocal education but also significantly enhanced educational equity and quality. With the support of intelligent technology, educational resources have transcended geographical boundaries, enabling students in remote areas to access high-quality vocal training. This transformation has not only accelerated the dissemination of vocal knowledge but also sparked students' passion and pursuit of vocal art. Moreover, the intelligent teaching model is flexible and personalized, allowing students to tailor their learning based on their individual conditions and interests, effectively unlocking their potential and helping them achieve their artistic dreams. Therefore, I believe that the intelligent transformation of teaching models is an inevitable trend in the future of vocal education, injecting new vitality into the inheritance and innovation of vocal art. Previous studies have explored the intelligent transformation of teaching models, highlighting the potential of intelligent technology in vocal education. However, most of these studies remain at the theoretical level, lacking in-depth exploration of the practical effects and impacts in actual teaching. Building on this, this article further analyzes the specific practices of the intelligent transformation teaching model in vocal education, including the application of intelligent evaluation systems and the establishment of virtual teaching and research rooms. These innovative measures have not only improved teaching efficiency but also promoted the equitable distribution of educational resources. Through case studies, we find that the intelligent transformation teaching model has achieved significant success in vocal education, providing new directions for its future development (Douding Network, 2024; Douding Network, 2024).

**2. Intelligent reform of creation path:** I believe that the intelligent reform has not only profoundly transformed the teaching model of vocal education but also had a significant impact on the creative process. In terms of creation, the application of intelligent technology has shifted the creation of vocal works from being primarily human-led to a new model of human-machine collaboration. Advanced technologies like generative AI have provided vocal creators with unprecedented sources of creativity, enabling them to break through traditional stylistic boundaries, integrate diverse elements, and produce innovative and unique works. This innovation not only enriches the diversity of vocal art but also provides creators with new sources of inspiration. Additionally, the emergence of voice cloning technology has further propelled changes in the field of vocal creation. This technology can accurately replicate and simulate specific voices, offering new possibilities for the creation and performance of vocal works. However, this has also sparked discussions about creative ethics, raising questions about how to reasonably utilize voice cloning technology while respecting originality and maintaining artistic individuality. Compared to previous studies, this research stands out by delving into the deeper impacts of intelligent reform on vocal creation beyond just surface-level technical applications. Through case analysis, we find that intelligent technology has not only accelerated the efficiency of the creative process but also, more importantly, sparked creators' desire to explore new forms of vocal art. The combination of generative AI and voice cloning technology has not only expanded the boundaries of creation but also prompted creators to consider how to coexist harmoniously with technology while maintaining artistic purity. In addition, this study also emphasizes that under the background of intelligent reform, creators need to constantly improve their technical literacy and aesthetic ability to adapt to the rapidly changing creative environment (Toutiao (APP), 2023; Original document, 2025; People Library, 2024).

**3. Intelligent improvement of performance form:** With the rapid advancement of intelligent technology, the form of performance is undergoing an unprecedented transformation. The integration of holographic projection and augmented reality not only breaks the limitations of traditional physical stages but also immerses the audience in a world where the virtual and the real blend seamlessly. This technology not only enhances the visual impact of performances but, more importantly, it introduces new narrative methods and emotional expression channels to performances. Audiences are no longer mere spectators; they become part of the performance, interacting with virtual characters to co-create its meaning. In my view, this intelligent enhancement of performance forms is not only a tribute and continuation of traditional art forms but also a bold exploration of future artistic possibilities. It prompts us to consider how, in today's world where technology and art are increasingly intertwined, we can maintain the purity and humanistic care of art while fully utilizing the power of technology to offer audiences a richer and more diverse artistic experience. Previously, scholars discussing the impact of intelligent technology on performance art often focused on the development and innovation of technology itself. However, I believe the true challenge lies in maintaining the soul and depth of art amidst the wave of technology. Intelligent technology should not be seen merely as a tool or means but as a new medium for artists to express their thoughts, emotions, and stories. Therefore, in the process of enhancing the intelligence of performance forms, there needs to be a greater emphasis on the deep integration of art and technology, encouraging artists to actively explore the possibilities brought by new technologies while adhering to the essence of art, ensuring that technology serves art rather than dominates it. Only in this way, we can create performance works with both the sense of the times and artistic value under the promotion of intelligent technology, bringing unprecedented artistic enjoyment to the audience (Han, S., 2025; Yang, W. and Liang, L., 2023).

**4. Reconstruction of ecological education:** Amid the wave of intelligent technology, the restructuring of the educational ecosystem has become an unavoidable topic. I believe that the core of this restructuring lies in balancing the strengths of traditional education with the benefits of intelligent technology to achieve a comprehensive upgrade in education. Intelligent technology offers unprecedented resources and tools for vocal music education, such as big data, cloud computing, and artificial intelligence. These technologies can significantly enhance teaching efficiency, broaden teaching perspectives, and provide learners with more personalized and diverse learning experiences. However, we must also be cautious about the potential negative impacts of excessive technological integration, such as the loss of humanistic care in education and the limitation of emotional communication among learners. Previous studies have often focused on the application cases and outcomes of intelligent technology in education, but have rarely explored the transformation of educational philosophies and concepts behind these technologies. The restructuring of the educational ecosystem requires not only technological innovation but also a breakthrough in educational philosophy, which involves re-examining the essence and purpose of education and considering how technology can serve the core values of education, such as fostering students' creativity, critical thinking, and humanistic care. (Tingyu, C., 2023; Original document, 2024; Xin, Q., 2023)

Therefore, the ecological reconstruction of education should focus on: first, maintaining the essence and humanistic care of education, ensuring that technology supports educational goals rather than replacing humanistic values; second, fostering positive interaction between learners and technology to develop their innovative thinking and practical skills; third, enhancing the integration and sharing of educational resources to promote both the equity and quality of

education. Through these measures, it is hoped that with the support of intelligent technologies, vocal music education will advance towards a more prosperous, diverse, and sustainable future.

In summary, the innovative trend of intelligentization in vocal art forms undoubtedly infuses new vitality and possibilities into the development of vocal art. It not only drives comprehensive innovation in the creation, teaching, and appreciation of vocal art but also paves new paths for its future development. In this process, we need to actively embrace technology and fully utilize intelligent tools like artificial intelligence to inject more wisdom and strength into the development of vocal art. At the same time, we must maintain a cautious and rational attitude, paying attention to the ethical and cultural challenges that technology may bring, ensuring that vocal art retains its unique charm and value in the digital age. Only by doing so can we collectively witness the intelligent trend leading vocal art to shine with even more brilliant and colorful brilliance.

## Conclusion

The final conclusion of this study, after thorough exploration and analysis, is that the ethical considerations of artificial intelligence technology and the value of vocal art are crucial for driving innovation in the form of vocal art. By integrating ethical considerations throughout the process of vocal creation, performance, and education, and establishing a dynamic evaluation and feedback mechanism, we can ensure that the application of AI technology in these areas is both justified and reasonable, while also being able to promptly address any issues that may arise. Moreover, coordinated development across different dimensions is essential. We must fully leverage the innovative opportunities that AI technology brings to vocal art while ensuring that artistic values remain intact. Looking ahead, as technology continues to advance and its applications expand, we have every reason to expect that AI technology will better serve the development of vocal art, jointly promote the innovation and prosperity of vocal art forms, and make greater contributions to the advancement of human culture.

This study still has limitations, especially the exploration of practical application is not sufficient. In order to further deepen the research, we suggest that future work can be carried out from the following aspects: First of all, we should strengthen interdisciplinary cooperation, deeply integrate knowledge from multiple fields such as artificial intelligence, ethics and vocal art, and jointly explore more comprehensive and in-depth solutions. Secondly, the scope of empirical research should be expanded to verify and improve the proposed ethical principles and art value transformation mechanism through more practical cases. Finally, we should keep an eye on the latest developments in technology and adjust our research direction and methods in time to ensure that our research results can keep up with the pace of the times and provide strong support for the future development of vocal art.
